- 1. (original) A system for displaying a driving scene to a driver of an automobile, the

  system comprising: a) at least one camera having a field of view and facing in the

  forward direction of the automobile and capturing images of the driving scene, the

  images comprised of pixels of the field of view in front of the automobile, b) a

  control unit that receives the images from the camera and applies a salt and pepper

  noise filtering to the pixels comprising the received images, the filtering improving

  the quality of the image of the driving scene received from the camera when degraded

  by a weather condition and c) a display that receives the images from the control unit

  after application of the filtering operation and displays the images of the driving

  scene to the driver.
  - (original) The system as in Claim 1, wherein the salt and pepper noise filtering applied by the control unit is a median filter.
  - (original) The system as in Claim 1, wherein the salt and pepper noise filtering applied by the control unit is a SUSAN filter.
- 4. (original) The system as in Claim 1, wherein the control unit further applies a
  histogram equalization operation to the intensities of the pixels comprising the
  filtered images, the histogram equalization operation further improving the quality of
  the images of the driving scene when degraded by the weather condition.

- (original) The system as in Claim 4, wherein the control unit further applies image
   recognition processing to the images following the histogram equalization operation.
- 6. (original) The system as in Claim 5, wherein the control unit applies image recognizing processing to the images to identify objects therein of at least one predetermined type.
- 7. (original) The system as in Claim 6, wherein objects of the at least one predetermined type comprise at least one selected from the group of: pedestrians, other automobiles, traffic signs, traffic controls, and road obstructions.
- 1 8. (original) The system as in Claim 6, wherein objects of the at least one predetermined
  2 type identified in the images are enhanced by the control unit for display by the
  3 display.
  - (original) The system as in Claim 6, wherein the control unit further identifies
     features in the images of at least one predetermined type.
- 10. (original) The system as in Claim 9, wherein the features of at least one
  predetermined type identified in the images are enhanced by the control unit for display by the display.

- (original) The system as in Claim 9, wherein the features of at least one predetermined type comprise borders of the roadway.
- 12. (original) The system as in Claim 1, wherein the display is a head-up display (HUD).
- 13. (original) The system as in Claim 1, wherein the control unit further applies image recognition processing to the images following the filtering.
- 14. (original) A method of displaying a driving scene to a driver of an automobile, the

  method comprising the steps of: a) capturing images of the driving scene in the

  forward direction of the automobile, the images comprised of pixels of the field of

  view in front of the automobile, b) salt and pepper noise filtering the pixels

  comprising the captured images, the filtering improving the quality of the images of

  the driving scene captured when degraded by a weather condition and c) displaying

  the images of the driving scene to the driver after application of the filtering

  operation.
- 15. (original) The method as in Claim 14, wherein the step of salt and pepper noise
  2 filtering of the pixels comprising the images is followed by the step of applying a
  3 histogram equalization to the filtered pixels.

- 16. (original) The method as in Claim 14, wherein the step of salt and pepper noise
  2 filtering of the pixels comprising the images is followed by the step of applying
  3 image recognition processing to the filtered pixels.
- 1 17. (new) The system of claim 1, wherein the camera is an infrared camera and the
  2 weather related condition creates a spotty temperature effect in the infrared
  3 frequencies.
  - 18. (now) The system of claim 1, wherein the weather related condition is precipitation, which interferes with the driver's view of the driving scene.
- 19. (new) The method of claim 14, wherein the camera is an infrared camera and the
  weather related condition creates a spotty temperature effect in the infrared
  frequencies.
  - 20. (new) The method of claim 14, wherein the weather related condition is precipitation, which interferes with the driver's view of the driving scene.
